### **Buy now**

Buy Nandrolona F - Fenandrol by Balkan Pharmaceuticals at Bulk Price  
Nandrolone F is a drug in the injectable form. It is an anabolic steroid with high androgenic activity. The drug promotes the assimilation of amino acids, the synthesis of protein, gives a moderate increase in dense muscle mass and positively affects the strength indicators. Also, Nandrolone F promotes rapid utilization of fatty deposits and positively affects joints.

The active substance of the drug is nandrolone phenylpropionate, which determines its specific effect. The substance is quickly absorbed, but has a short exposure time, about 2-3 days.

A distinctive property of the drug is the enhancement of collagen synthesis, it in turn has an anti-inflammatory effect, strengthens ligaments, joints and the bone

system. Among other things, nandrolone phenylpropionate helps to strengthen immunity.

### **Course of admission**

The individual course of taking Nandrolone F is made according to the experience of the athlete and the desired results. Nevertheless, the optimal course of admission lasts from 1 to 2 months, at dosages of 100-600 mg per week for men and 50-100 mg per week for women. The frequency of injections recommended to men - every two or three days, women - once every three days.

The course of Nandrolone F gives the best effects in combination with Methandrostenolone, Winstrol, Testosterone P, Masteron and Turinabol. In this case, the dosage of phenylpropionate itself and the rest of the steroids is reduced.

### **Side effects**

Androgenic side effects are quite rare, since the androgenic activity of Nandrolone F is only 30% of testosterone. If the dosage is significantly exceeded, baldness may develop, or on the contrary, the growth of the hair cover on the face and body may increase, acne develop and the sebaceous glands work. The most common side effects of nandrolone phenylpropionate with long-term courses of admission and large doses are gynecomastia, excessive fluid retention in the body and other estrogenic manifestations. With them, anti-estrogens cope (for example: Tamoximed, Clomed), this will minimize the risk of side effects.

### **Reviews**

Moderate, but stable growth of muscle mass.

The phenomenon of rollback at the end of the reception is absent or completely insignificant.

Fat burning. Phenyl propionate nandrolone stimulates the body to use fat stores as an energy source.

Synthesis of collagen. Due to the increased formation of collagen, the drug strengthens ligaments and joints.

Strengthening of immunity.

Anti-inflammatory effect.

Substance nandrolone fenil
