Cytomed is a non-steroid drug in the form of tablets. It is the synthetic equivalent of the thyroid hormone. The thyroid gland produces two hormones: L-T4 (L-thyroxine) and L-T3 (L-triiodothyronine). The secretion of these biologically active substances increases the need for tissues in oxygen, the growth and differentiation of tissues, the level of metabolism of proteins, fats and carbohydrates increases, and the process of fat burning and energy processes are accelerated.

Regarding L-T4, the hormone L-T3 is several times faster and more potent, it is it that simulates the drug Cytomed, unlike other drugs of similar action.

In small doses, the drug has an anabolic effect, but with excessive concentration - it starts the catabolism process, so it's worth paying special attention to the dosage.

Depending on the dosage, the drug will help to part with the subcutaneous fat during the drying period with incredible speed, or gain weight.

Course of admission

The most common and safe dose in the drying process is 50 µg daily for half an hour before breakfast. The use of T3 should be combined with a high protein diet, 2 grams of pure protein per kg of weight.

During the period of muscle mass, it can also be combined with the use of TK, only at a lower dose - 25 mcg daily. This will enhance protein synthesis.

After taking, 95% of the drug is absorbed within 4 hours.

T3 strongly binds to proteins in the blood, while the maximum pharmacological effect occurs in 2-3 days.

Side effects

If the recommended dosage is exceeded, headache, anxiety, irritability, sweating, tachycardia, arrhythmia, angina pectoris, heart failure, dysmenorrhea, allergic reactions may occur.

Reviews

Regulation of intensity and quality of metabolism of proteins, fats and carbohydrates.

Regulation of the cardiovascular system (heart rate, vascular tone), respiratory system, tone and muscle contractility.

Improves the activity of the central nervous system, memory function, psyche.
