Oxiged 50mg (EPF) is an **oxymetholone** preparation, an extremely powerful anabolic and androgenic steroid with quick but short action. For use in sports, it is recommended exclusively to athletes with sports pharmacology (not the best choice for a beginner). In iron sport, it is used mainly in strength and mass-gaining courses, when you need to quickly gain muscle mass and pronouncedly increase strength indicators.

The active substance of the drug, the **oxymetholone** steroid, is not a novelty for domestic amateurs and sports professionals. On sale in the pharmaceutical

markets of the United States and Europe, it appeared in the 60s of the last century under the trademarks Anapolon and Anadrol. Like many steroid hormones synthesized in the mid-20th century, oxy (slang reduction) was initially positioned only as a medicine. Bodybuilders did not immediately appreciate its properties. Then the main sport's drug was considered methandienone.

Steroid profile **Oxiged 50mg** from EPF: anabolic activity index-320% of testosterone, androgen activity index-45% of testosterone; half-life-no more than 15 hours, detection time-at least 8 weeks; suppression of HPTA function (reduction of testosterone synthesis) - Yes, strong; aromatization (conversion to estrogens) - Yes, partial; hepatotoxicity (liver toxicity) – Yes, moderate.

Structurally, **oxymetholone** is a modification of dihydrotestosterone, which causes some of its pharmacological qualities.

Steroid Effects:

- A set of muscle mass;
- Growth in power indicators;
- Strengthening blood formation;
- Increased Stamina;
- Acceleration of recovery;
- Relieving joint pain.

The effect of the drug is partially mediated: by reducing the level of SHBG (sex hormone-binding globulin) and increasing the concentration of erythropoietin (ERO).

Side effects **Oxiged 50mg** (Euro Prime Pharmaceuticals) can be androgenic, estrogenic or progestogenic in nature: increased aggression, acne, greasy skin, water retention, increased blood pressure, baldness, testicular atrophy, prostate hypertrophy, gynecomastia; some other side effects.

Nevertheless, subject to recommendations and the exclusion of contraindications, this is a relatively safe steroid, at least for men.
